Nutrition Research Project of the Year winners

Benefits of LipiSpense - dispersion technology applications

Lipisperse is a patented, award winning dispersion technology, developed and manufactured in Australia by Pharmako Biotechnologies.

The LipiSpense research project aims to show that improvement in bioavailability can lead to:

- improved efficacy
- faster onset of action
- lower doses
- improved user compliance.

These lead to improved health and quality of life outcomes for consumers, better use of resources from an ecological perspective, and better outcomes from a business perspective.

Lipisperse has been formulated with multiple actives, with pharmacokinetic and clinical research so far on materials including:

- Hydrocurc
- Levagen+
- VeriSpense
- Fisetin
- Boswellia

Research has been conducted in partnership with RDC Global, Gencor Pacific and several leading universities.

The judges were very impressed with the company's evidence of LipiSpense's ability to increase the bioavailability and functionality of lipophilic actives. NutraIngredients-Asia Editor-in-Chief Gary Scattergood said: "Pharmako Biotechnologies has a deep commitment to research and this was clearly evident in this entry, which took the top place in an incredibly competitive category. This is a very worthy winner of our Nutrition Research Project of the Year Award."
